

# Tofu Ling Science Activity

## Growing and Gathering Seeds

The Ling family gathered seeds for their winter food. Fill a small paper cup two-thirds full of soil. Sprinkle on top of the soil grass seed and then water. Place the paper cup with soil and seeds near a window where sunlight can warm the seeds. Make sure that you keep the soil moist and continue to water it daily. Sometimes you may need to water it several times a day. Depending on the seeds that you used they will begin to sprout tiny green blades of grass in a week to two weeks. Record the grass growing by drawing a picture of how it looks throughout the growth cycle. On the lines below the pictures record the dates.

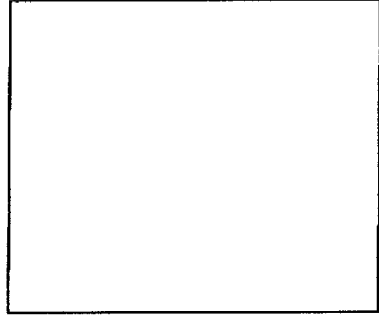

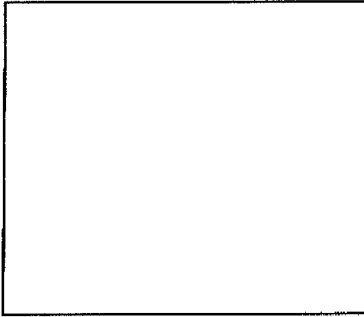

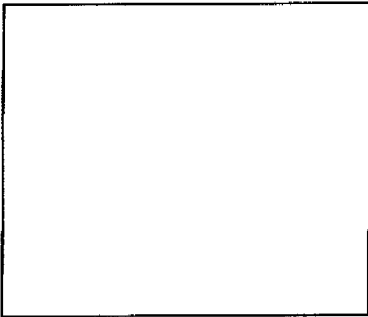

Day one:

---

---

---

---

---

---

How many days did it take until tiny green blades of grass began to sprout? \_\_\_\_\_

How many days until the grass showed signs of seeds? \_\_\_\_\_

How were the seeds that you planted alike or different from the seeds that grew in your cups?

---

Do you think that you could plant the seeds from your grass plants and grow additional grass? Why or why not?

---
